The hybrid antigen (see also AAW19955-67) is combined in vitro with a HSP to form a complex that, when administered to a subject, induces an immune response. Target antigen-HSP complexes can be used to treat infectious diseases, or to treat cancers by eliciting an immune response to a tumour antigen. Alternatively, a nucleic acid encoding the HSP and the target antigen is administered such that the HSP and target antigen is administered such that the HSP and target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen is administered such that the HSP and the target antigen that the HSP and the target and the target and the target and the ta

The invention relates to conjugate peptides engineered to noncovalently behind to heat shock proteins (hsp). A method of identifying a hsp binding peptide comprises (a) contacting a phage display library having bacteriophage expressing, in a surface protein, inserted peptides with a hsp target, and bound to a benzoquinone ansamycin antibictic (BAA), in a physiologic binding buffer; (b) isolating a phage binding to the hsp target; and (c) identifying the inserted peptide expressed. The peptides which bind to a hsp can be used as tethering peptides for a hsp which may serve as an accessory in a chaperone process and/or may comprise a cytokine. They can also be coupled to antigens to induce an immune response. Such compositions can be used for treating neoplastic disease, e.g. cancers, infectious diseases, e.g. diseases caused by a bacterium, virus, protozoan, mycoplasma, fungus, yeast, parasite or prion, or a missimmune system, e.g. acquired immune deficiencies or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a hear shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti cancer vaccine for the treatment of melanoma comprises a heat shock

The immunogenic complex is useful for inducing both humoral and cellular immunity, especially for enhancing the anti-viral immune response, in a human or non-human subject. The immunogenic complex is particularly useful as a vaccine for preventing or ameliorating viral infections, e.g. hepatitis, influenza, mumps, HIV (human immunodeficiency virus) infection, pollo, tick-borne encephalitis or ebola virus infection. AAU80555-AAU80570 represent heat shock binding peptides which may be used as javelins
antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention. (Updated on 11-SEP-2003 to standardise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunogenic complex; non-pathogenic multi-component viral particle; javelin; heat shock protein; humoral immunity; cellular immunity; anti-viral immune response; viral infection; hepatitis; influenza; mumps; HIV infection; human immunodeficiency virus; polio; tick-borne encephalitis; ebola virus infection; heat shock binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New heat shock protein-based viral vaccines, useful for enhancing antiviral immune response in an organism, particularly as a vaccine for preventing or ameliorating viral infections, e.g. hepatitis, influenza or

                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatability complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is a javelin peptide
                                                                                                                                                                                                                                                                                                                                                                      A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.
                                                                                                                                                                     Antigenic complex; epitope; heat shock protein; HSP; tether; javelin; major histocompatability complex; MHC; therapy; immune response; malignancy.

The invention relates to a method for identification of a peptide binding to a heat shock protein (hsp) involving contacting a phage display contacted peptides with an hsp target or hsp target bound to a benzoquinone ansamycin antiblotic in a physiological binding buffer or binding buffer, isolating the phage, and identifying the inserted peptide expressed in the surface protein of the phage. The method is useful for identifying a peptide for inducing an immune response, for the treatment of infectious diseases (e.g. diseases caused by a bacterium, witcus, or infectious diseases (e.g. diseases acused by a bacterium, virus, or infectious diseases (e.g. diseases sursed by a bacterium, virus, or papillomavirus, a herpes virus such as herpes simplex virus, a retrovirus cuch as human immunodeficiency virus in 2, a hepatitis virus, a retrovirus cuch as human immunodeficiency virus, repiratory syncytial virus, a cytomegalovirus, an adenovirus, repiratory syncytial virus, a cytomegalovirus, an adenovirus, streptococcus, Enterococcus, Clostridium, Escherichia, Klebsiella, Vibrio or Mycobacterium, a protozoan such as an amoeba, malarial parasite or Trypanosoma cruzi), or carcinoma of the prostate, ovarian carcinoma, carcinoma of the prostate, ovarian carcinoma, carcinoma of the prostate, ovarian carcinoma of the breast.

Cu terine carcinoma, colon carcinoma, carcinoma of the breast.

Cu terine carcinoma, colon carcinoma, carcinoma of the lung, gilloblastoma or astrocytoma) or immunological diseases (e.g. AIDS) and for treating carcinoma carcinoma, carcinoma carcinoma, carcinoma or the prostate, ovarian carcinoma of the prostation and manamental diseases such as theumatodid arthritis, systemic lung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identification of a peptide binding to a heat shock protein involves contacting a phage display library of several bacteriophages expressing in a surface protein of inserted peptides with a target followed by isolation and identification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for identification of a peptide binding to a heat shock protein (hsp) involving contacting a phage display library of several bacteriophage which express, in a surface protein, several inserted peptides with a high target bound to a benzoquinone ansamycin antibiotic in a physiological binding buffer or binding buffer, isolating the phage, and identifying the inserted peptide expressed in the surface protein of the phage. The method is useful for identifying a peptide, which binds to a heat shock protein, which is used in a conjugate peptide for inducing an immune response, for the treatment of infectious diseases (e.g. diseases caused by a bacterium, virus, protozoan, mycoplasma, fungus, yeast, parasite or prion such as human papillomavirus, a herpes virus such as herpes simplex virus, a retrovirus such as human immunodeficiency virus 1 or 2, a hepatitis virus, an
                                                                                                                                                                                                                                                                                                                                                               infectious disease; human papillomavirus; herpes virus; retrovirus; hepatitis virus; influenza virus; rhinovirus; respiratory syncytial virus; cytomegalovirus; adenovirus; malignant disease; neoplastic disease; sarcoma; lymphoma; leukaemia; melanoma; carcinoma; breast; prostate; ovary; cervix; uterus; colon; lung; glioblastoma; astrocytoma; immunological disease; AIDS; autoimmune disease; rheumatoid arthritis; systemic lupus erythematosus; diabetes mellitus; thyroiditis; multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identification of a peptide binding to a heat shock protein involves contacting a phage display library of several bacteriophages expressing in a surface protein of inserted peptides with a target followed by

influenza virus, a rhinovirus, respiratory syncytial virus, a cytomegalovirus, an adenovirus, Mycoplasma pneumoniae, a bacterium of the genus Salmonella. Staphylococcus, Streptococcus, Enterococcus, Clostridium, Escherichia, Klebalella, Vibrio or Mycobacterium, a protozoan such as an amoeba, malarial parasite or Trypanosoma cruzi), or malignant diseases, for treating or preventing neoplastic diseases (e.g. sarcoma, lymphoma, leukaemia, melanoma, carcinoma of the breast, carcinoma, of the prostate, ovarian carcinoma, carcinoma of the cervix, uterine carcinoma, colon carcinoma, carcinoma of the lung, glioblastom a satrofmenune diseases or immunological diseases (e.g. AIDS) and for treating autoimmune diseases uncolon arthritis, systemic lupus erythematosus, diabetes mellitus, thyroiditis and multiple sclerosis. This sequence represents an hsp related peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel hybrid antigen which comprises at leas one antigenic domain of an infectious agent or tumour antigen and a binding domain that non-covalently binds to a heat shock protein. The invention may be useful for the production of compounds with an antimicrobial or cytostatic activity. In addition, the invention may prove useful for the production of a vaccine or for gene therapy. The composition and methods disclosed are useful for preventing or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hybrid antigen; antigenic domain; infectious agent; tumour antigen;

The invention relates to hybrid antigens comprising at least one antigenic domain of an infectious agent or tumour antigen, at least one binding domain that non-covalently binds to a heat shock protein (hsp), and at least one peptide linker between them. Also disclosed are: (a) a composition for inducing an immune response to an infectious agent or tumour antigen comprising at least one of the hybrid antigens or a complex of at least one heat shock protein and at least one of the hybrid antigens, (b) a method for inducing an immune response to an infectious agent or tumour antigen by administering a hybrid antigen and a heat shock protein, where the hybrid antigen and the heat shock protein are non-covalently bound, and (c) treating an infectious disease or cancer by administering a hybrid antigen and a heat shock protein a preferably hsp70. The composition is administered via oral or protein is preferably hsp70. The composition is administered via oral or for treating or preventing cancer or infectious disease. The new peptide linkers give the antigens improved activity. Note: Many of the SEQ ID Nos
                                                                                                                                                                                                                                ö
infectious diseases or cancer. The present sequence is that of a peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hybrid antigen useful for treating an infectious disease or cancer, comprises an antigenic domain from the infectious agent or cancer joined to a heat shock protein binding domain through an improved linker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hybrid antigen; antigenic domain; infectious agent; tumour antigen; binding domain; heat shock protein; hap; immune response; infectious disease; cancer; cytostatic; antimicrobial; immunostimulant.

Also disclosed are: (a) a composition for inducing an immune response to an infectious agent or tumour antigen comprising at least one of the hybrid antigens or a complex of at least one heat shock protein and at least one of the hybrid antigens, (b) a method for inducing an immune response to an infectious agent or tumour antigen by administering a hybrid antigen and a heat shock protein, where the hybrid antigen and the heat shock protein are non-covalently bound, and (c) treating an infectious disease or cancer by administering a hybrid antigen and a heat shock protein. The heat shock protein are protein; us preferably hspy0. The composition is administered via oral or parenteral route. The hybrid antigen is useful in preparing a composition for treating or preventing cancer or infectious disease. The new peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hybrid antigen useful for treating an infectious disease or cancer, comprises an antigenic domain from the infectious agent or cancer joined to a heat shock protein binding domain through an improved linker
are replicated more than once in the specification but the sequences of these replicated SEQ ID Nos are not the same. This sequence represents heat shock protein binding sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to the use of an immunogenic complex, comprising a non-pathogenic multi-component viral particle covalently linked to a javelin molecule (preferably a peptide) that selectively binds to a heat shock protein. The immunogenic complex is useful for inducing both humoral and cellular immunity, especially for enhancing the anti-viral immune response, in a human or non-human subject. The immunogenic complex is particularly useful as a vaccine for preventing or ameliorating viral infections, e.g. hepatitis, influenza, mumps, HIV (human immunodeficiency virus) infection, polio, tick-borne encephalitis crebolar infection. ANU80735-AAU80742 represent javelin peptides, comprising javelin and linker regions, which may be covalently conjugated to multi-component viral particles
linkers give the antigens improved activity. Note: Many of the SEQ ID Nos are replicated more than once in the specification but the sequences of these replicated SEQ ID Nos are not the same. This sequence represents a heat shock protein binding sequence.
                                                                                                                                                                                                                                                                                                                                   Immunogenic complex; non-pathogenic multi-component viral particle; javelin; heat shock protein; humoral immunity; cellular immunity; anti-viral immune response; viral infection; hepatitis; influenza; mumps; HIV infection; human immunodeficiency virus; polio; tick-borne encephalitis; ebola virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New heat shock protein-based viral vaccines, useful for enhancing antiviral immune response in an organism, particularly as a vaccine for preventing or ameliorating viral infections, e.g. hepatitis, influenza or HIV infection.

The immunogenic complex is useful for inducing both humoral and cellular immunogenic complex is useful for anti-viral immune response, in a human or non-human subject. The immunogenic complex is particularly useful as a vaccine for preventing or ameliorating viral infections, e.g. hepatitis, influenza, mumps, HIV (human immunodeficiency virus) infection, polio, tick-borne encephalitis crebola virus infection. ANU80715-AAU80742 represent javelin peptides, comprising javelin and linker regions, which may be covalently conjugated to multi-component viral particles
                                                                                                                                                                                                                                                                                                                                                                                                                  Immunogenic complex; non-pathogenic multi-component viral particle; javelin; heat shock protein; humoral immunity; cellular immunity; anti-viral immune respones; viral infection; hepatitis; influenza; mumps; HIV infection; human immunodeficiency virus; polio; tick-borne encephalitis; ebola virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New heat shock protein-based viral vaccines, useful for enhancing antiviral immune response in an organism, particularly as a vaccine for preventing or ameliorating viral infections, e.g. hepatitis, influenza or HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to the use of an immunogenic complex, comprising a non-pathogenic multi-component viral particle covalently linked to a javalin molecule (preferably a peptide) that selectively binds to a heat shock protein. The immunogenic complex is useful for inducing both humoral and cellular immunicy, especially for enhancing the anti-viral immune response, in a human or non-human subject. The immunogenic complex is particularly useful as a vaccine for preventing or ameliorating viral infections, e.g. hepatitis, influenza, mumps, HIV or ebola virus infection, anusuodeficiency virus) infection, polio, tick-borne encephalitis or ebola virus infection. ANUS0735-AAUS0742 represent javelin neptides, comprising javelin and linker regions, which may be covalently conjugated to multi-component viral particles

comprising a non-pathogenic multi-component viral particle covalently linked to a javelin molecule (preferably a peptide) that selectively binds to a heat shock protein. The immunogenic complex is useful for inducing both humoral and cellular immunity, especially for enhancing the anti-viral immunosenic complex is particularly useful as a vaccine for preventing or ameliorating viral infections, e.g. hepatitis, influenza, mumps, HIV (human immunodeficiency virus) infection, polio, tick-borne encephalitis comprising javelin and linker regions, which may be covalently conjugated to multi-component viral particles
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New heat shock protein-based viral vaccines, useful for enhancing antiviral immune response in an organism, particularly as a vaccine for preventing or ameliorating viral infections, e.g. hepatitis, influenza or HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYBS01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T celle-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to the use of an immunogenic complex,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 64; DB 5; Length 12; 100.0%; Pred. The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, tyrosinase, tyrosinase related protein 1, tyrosinase antigens, GMZ, antigens, GMZ, antigens, GMZ, antigens, GMZ, antigens of the melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANJ1980-AAU72481 represent melanoma antigen peptides of the invention
                                            cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase abdE; NYESE01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vacCine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of induction of an immune response,
                                                                                                                                                                                                                                                                                                                                           100.0%; Score 64; DB 4; Length 16; 100.0%; Pred. No. 0.0068; ative 0; Mismatches 0; Indel8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hoe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tyrosine-derived melanoma antigen, javelin peptide #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mayhew M,

                                                                                                                                                                                                                                                            The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, CMY, a mitgento portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUT1980-AAUT12481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                    cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYSE01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T celle-1; human.

           a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp.100, MAGB antigens, BAGB antigens, NYESOL, MART antigens, GMZ, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, GMZ, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response
comprising administration of an immunotherapeutic composition, comprising

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, tyrosinase, tyrosinase related protein 1, tyrosinase antigens, GMZ, antigens, GMZ, antigens, OFTLOS antigens and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AdVI1980-AdVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigens, CM2, antigency operations and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

                                                                                                                                                                                                                                                                                The invention relates to a method of induction of an immune response, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEGO1, MART antigens, GM2, antigent portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANV1980-ANV72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                  Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, GMZ, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase BAGE; WYSS01; GMZ; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of induction of an immune response,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti cancer vaccine for the treatment of melanoma comprises protein and a melanoma antigen i.e. tyrosinase.

                                                                                                        comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, WART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the batter shock protein. The composition is useful for inducing an immune response
comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NVES01, MART antigens, GM2, antigens portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the bat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANUT1980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase BAGE; NYBE01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen bound to the javelin molecule; where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprises a heat shock
                                                                                                                                                                                                                                                                                      GM2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEsOl, MART antigens, GM2, antigent portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAUT1980-AAUT2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                   Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; ABGE; NYES01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of induction of an immune response,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase, ratigence, BAGE antigens, NYESQ1, MART antigens, GM2, antigence portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUTIS80-AAUTIS481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                         melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immuncherapeutic; heat shock protein; tyrosinase BAGE; WRSB01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti cancer vaccine for the treatment of melanoma comprises a heat shock

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule; ann-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANT1980-ANU72481 represent melanoma antigen peptides of the invention
                                                                                   melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase abdS; NYSB01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                       The invention relates to a method of induction of an immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 64; DB 4; Length 17; 100.0%; Pred. No. 0.0072; ive 0; Mismatches 0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigens, GM2, antigent portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AMV1980-AAV72481 represent melanoma antigen peptides of the invention

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigen is covalently bound to a javelin molecule, where the melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a hear shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEsO1, MART antigen is covalently bound to a javelin molecule, where the melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Melanoma antigen, MART-1, MAGE-1, gp100, cytostatic; immune response; immuncherapetic; heat shock protein; tyrosinase; BAGE; NYSE01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; favelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, tyrosinase, related protein 1, tyrosinase antigens, GMZ, antigens, GMZ, antigens, GMZ, antigens, MYESO1, MART antigens is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AMJ1980-AMJ72481 represent melanoma antigen peptides of the invention
shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU1980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen bound to the javelin molecule, where the melanoma shitgen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANV1980-AAV72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                      Melanoma antigen, MART-1, MAGE-1, gp100, cytostatic; immune response; immunchezpeutic; heat shock protein; tyrosinase; BAGE; WYSB61, GW2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; davelin molecule; melanoma antigen recognised by T cells-1; human.

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigens portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                 melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYE801; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 64; DB 4; Length 17;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEGO1, MART antigen is covalently bound and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUTISBO-AAUTISBI represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

                                                                                                                                                                                                                                                                                    ö
                                                                                                                       comparising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AMV71980-AAMV72481 represent melanoma antigen peptides of the invention
                                                            comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Melanoma antigen; MART-1; MAGB-1; gp100; cytostatic; immune response; immunotherapetuic; heat shock protein; tyrosinase; BAGB; NYESO1; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; davelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                              The invention relates to a method of induction of an immune response
                                                                                                                                                                                                                                                                                     Gaps

                                                          The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antiegen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigens portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat for the treatment of melanoma antigen peptides of the invention AMJ1980-AMJ7481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of induction of an immune response, comprising administration of an immunebreapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase artigens, garcein 2, gp 100, MAGE antigens, BAGE antigens, NTSEOL, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYSB01; GNZ; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.

The invention relates to a method of induction of an immune response, comprising administration of an immunotherspeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEsO1, MART antigen for antigen for these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANTIJS80-AAUT1281 represent melanoma antigen peptides of the invention
antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anti cancer vaccine for the treatment of melanoma comprises a heat shock

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of induction of an immune response, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigent portions and combinations of these. The melanoma antigen bound to the javelin molecule, where the melanoma antigen bound to the javelin molecule, and pound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                comprises a heat shock

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYES01, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                       Anti cancer vaccine for the treatment of melanoma comprises a heat shock

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigen protein 2, gp 100, MAGE antigens, BAGE antigens of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYEs01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                 The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigens, CM2, antigency portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAV71980-AAV72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                            Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; VYSES01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen selected from tyrosinase, tyrosinase related protein 1, tyrosinase ratigens, BAGE antigens, NYESO1, WART antigens, CM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the bat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUT1980-AAUT2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase tyrosinase trelated protein 1, tyrosinase related protein 2, gp 100, MAGES antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cancer vaccine for the treatment of melanoma comprises a heat shock

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigen from tyrosinase, tyrosinase antigens, BAGE antigens, NYEsO1, MART antigence from tyrosinase and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           melanoma comprises a heat shock

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AdVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase, tyrosinase, prosinase, prosinase, protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                     Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapentic; hat shock protein; tyrosinase BAGE; WISE01; GM2; tyrosinase related protein 1; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of induction of an immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100.0%; Score 64; DB 4; Length 18; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigens, BAGE antigens, NYEsOl, MART antigens, GM2, antigence portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; WYBS01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; favelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                   ö
                                                                                                                             The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigent c portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANU71980-AAU712481 represent melanoma antigen peptides of the invention

                                                                                                               The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase, ratigens, BAGE antigens, NYED1, MART antigens, GM2, antigent portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUTIS80-AAUTIS481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, 99 100, MAGE antigens, BAGE antigens, NYESO1, MART
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Melanoma antigen; MART-1; MAGB-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYEs01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
              antigen is covalently bound to a javelin molecule, where the melanoma stringen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancer vaccine for the treatment of melanoma comprises a heat shock in and a melanoma antigen i.e. tyrosinase.

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    melanoma comprises a heat shock

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEs01, MART antigen is covalently bound and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUT1980-AAUT2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                 Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the bat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Anti cancer vaccine for the treatment of melanoma compribes a heat shock
Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase BAGE; NYBE01; GM2; tyrosinase related protein 1; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; davelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase BAGE; NYES01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                               Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYSB01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                              The invention relates to a method of induction of an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 64; DB 4; Length 18; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, and to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma

                                                                              The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU712481 represent melanoma
related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEs01, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the pavelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti cancer vaccine for the treatment of melanoma comprises a heat shock

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAUT1980-AAUT2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gapa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                               Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYEs01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T celle-1; human.

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NESG1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Melanoma antigen, MART-1; MAGE-1; gp100, cytostatic; immune response; immuncherapeutic; heat shock protein; tyrosinase BAGE; NYSB01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of induction of an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                       The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase artiges, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AMU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen
Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response;
immunotherapeutic; heat shock protein; tyrosinase; aGGE; WSES01; GM2;
tyrosinase related protein 1; tyrosinase related protein 2; vaccine;
Javelin molecule; melanoma antigen recognised by T cells-1; human.

is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEsOl, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUT1980-AAUT2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Compsn. for inducing immune response contg. antigen and heat shock protein - also new hybrid peptide and related nucleic acid, for treatment of infectious diseases and tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hybrid peptides OVA-BiP (AAW19956) and BiP-OVA (AAW19957) comprise chicken OVA-peptide (see AAW19955) joined via a peptide linker to heat benck protein (HSP) BiP binding domain (see also AAW19951). The hybrid peptide can be combined in vitro with a HSP, such as hsp70, to form a complex that, when administered to a subject, induces an immune response
                                                                                                                                    Gaps

The hybrid peptide can be combined in vitro with a HSP, such as hsp70, to form a complex that, when administered to a subject, induces an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                        comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, pp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                       Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYES01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine;

The invention relates to a method of induction of an immune response, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase, related protein 1, tyrosinase related protein 2, 9p 100, MAGE antigens, BAGE antigens, NYE801, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen bound to the javalin molecule, where the melanoma antigen bound to the javalin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                 Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antigenic complex; epitope; heat shock protein; HSP; tether; javelin; major histocompatability complex; MHC; therapy; immune response; malignancy; chicken.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAE13446 standard; peptide; 19 AA
```

```
The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatability complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is Herpes simplex virus MHC class I peptide antigen
                                                                                                                                                                                                                                                                                                                                                             A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antigenic complex; epitope; heat shock protein; HSP; tether; javelin; major histocompatability complex; MHC; therapy; immune response; malignancy; chicken.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatability complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken MHC class I peptide antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antigenic complex, epitope, heat shock protein, HSP, tether, javelin, major histocompatability complex, MHC, therapy, immune response,
